

Climate Power 

21 August at 22:51 · 

Apparently the record-breaking heat, rapidly spreading wildfires, and unnaturally hot ocean temps don't count as evidence...

He did not say it isn't happening. You people can read? I presume you can, you just forgot to. So why argue with a different discussion. He says "an existential threat" which means extinction Can you provide a link to where the outcome is explained? Timescales? Milestones? Now if temperatures go up and up, there must be a world-average temperature where we all go. My guess is below +4'C. What number do you have in mind? Do you have a number?

If you cant answer his question, and mine, what answers do you have? OK it takes some specialist to, but where is their answer? Where is their website that lays all this down? The IPCC is the only thing around, and it is deeply flawed. Where in it, does it deal with those questions?

**Graham Swallow** Nice post, shame it's nonsense. What is the relevance of your temperature 'guess'? Why guess when you can quite easily find the information. You don't live very far from the European centre for medium weather forecasting. Have you bothered to ask the experts there? Reading university has a climate research department, have you asked? UEA has a climate research centre, have you asked? The met office is involved in climate modelling, have you asked? Where is your evidence that the IPCC report is 'deeply flawed'? For someone who claims to work for a company called 'Information Cascade', you haven't provided, nor bothered to seek out, much relevant information.

**Steve Hawthorne** you work very hard to not say anything. What is your easily available number? You avoid mentioning that, just your scary stalker-like take down.

You have not answered his question, nor mine, but have spent effort blocking. Why would anyone do that?

**Steve Hawthorne** come on Steve, at what temperature does extinction happen? +2 +4 +6 +8 +20 That is a number the ecmwf is not qualified to report on. They don't specialise in crop fails and germination. So what is your number Steve?

**Graham Swallow** Who is talking about extinction? Extinction of which species? Species are dying almost daily. How do you know what the ECMWF is competent to report on? What exactly are you competent to report on? Not much judging by your posts so far. Enough of your BS.

"Is climate change an existential threat to humanity" are the first words of this thread, in the main photo.

That is what "existential threat to humanity" means.

It means human extinction.

You really are a rude person.

Sometime in the future, your neighbours will be on the evening news, but they won't be saying "he was so quiet - who knew", they will be saying "the signs were always there". He (you) could be found insulting people on the internet and making thinly veiled threats, "I know where you live, I know where you work".

It's evidence of specific weather conditions. Making assumptions based on hysteria and misinformation doesn't count!

If it has happened before the theory is suspect.

If it has happened many times in recent history the theory is wrong or incorrect.

It is.

No evidence the oceans are warmer! We only measure the surface
